# Pulse Poll 1

---

**What's your experience level  
with Data Centers?**

Mankind has NEVER consumed less power and compute.  
We've only consumed more.

\$10-15 Million per MW

\$.03-\$.26/KWh Direct to Grid

100 Megawatt Mid-Market Build (without GPUs)  
=  
~ \$1 Billion

LAYERS OF COMPUTE — OWNERSHIP AT EVERY LEVEL

LAYER 1

## Power Generation & Grid

Nuclear, gas & renewable plants feeding the grid.  
Transmission lines, substations, utility contracts.  
The foundation everything above depends on.

Controlled by  
Utility & Energy Company

# Pulse Poll 2

---

**Would you be ok with a new AI Data Center being built nearby your town?**

# A Case Study

## The Surprising Heart of the Data-Center Boom

Loudoun County, Virginia, has embraced digital infrastructure—and its economic benefits.

## Lawmakers at odds over data centers as Virginia budget talks stall

## Take This Data Center and Shove It

Americans ain't puttin' up with these things no more. Welcome to Virginia, ground zero for data center defiance

## Loudoun homeowners battle Dominion Energy to save threatened property values

**2.67 GW**

Virginia data center power draw in 2022

**11+ GW**

New Data Center capacity expected by 2030 in Virginia

**~40 GW**

Dominion's contracting pipeline in Virginia

- Data centers made up 38% of the county's General Fund revenue and nearly half of its property tax revenue in FY2025
- In March 2025, the board ended the county's decades-old "by-right" zoning for data centers, requiring all new projects to undergo public review
- Projected grid capacity shortfall in the region over the next five years could double

# Will the real owner please stand up?

Your Applications

↑ *Most orgs account for this*

Your Cloud Provider

The Equipment Inside

↓ *Rarely evaluated*

The Country, State, County It Operates In

The Building

The Power

**Ownership of the modern data center is not held by one hand but distributed across every layer of the stack, from the fuel that feeds the generator to the public partnership that permits it to exist.**

# The Power Shortage is REAL, Ya'll!

## US Energy

~1,280 GW (Today)

>2,000 GW  
(Awaiting Allocation)

## US Data Centers

~100 GW (Today)

>700 GW  
(Awaiting Allocation)

### Behind-the-Meter

LNG Turbine/Gen-Set  
Bio-Mass  
Ammonia

9 Months- 3 Year Deployment

### Future Power Solutions

Nuclear SMR's  
GeoThermal  
Hydrogen Fuel Cells

2- 10+ Year Deployment

### Direct-To-Grid

Local Power Utility

3 - 10+ Year Deployment

# Pulse Poll 3

---

**What's the single most vulnerable component you've identified a real threat against?**

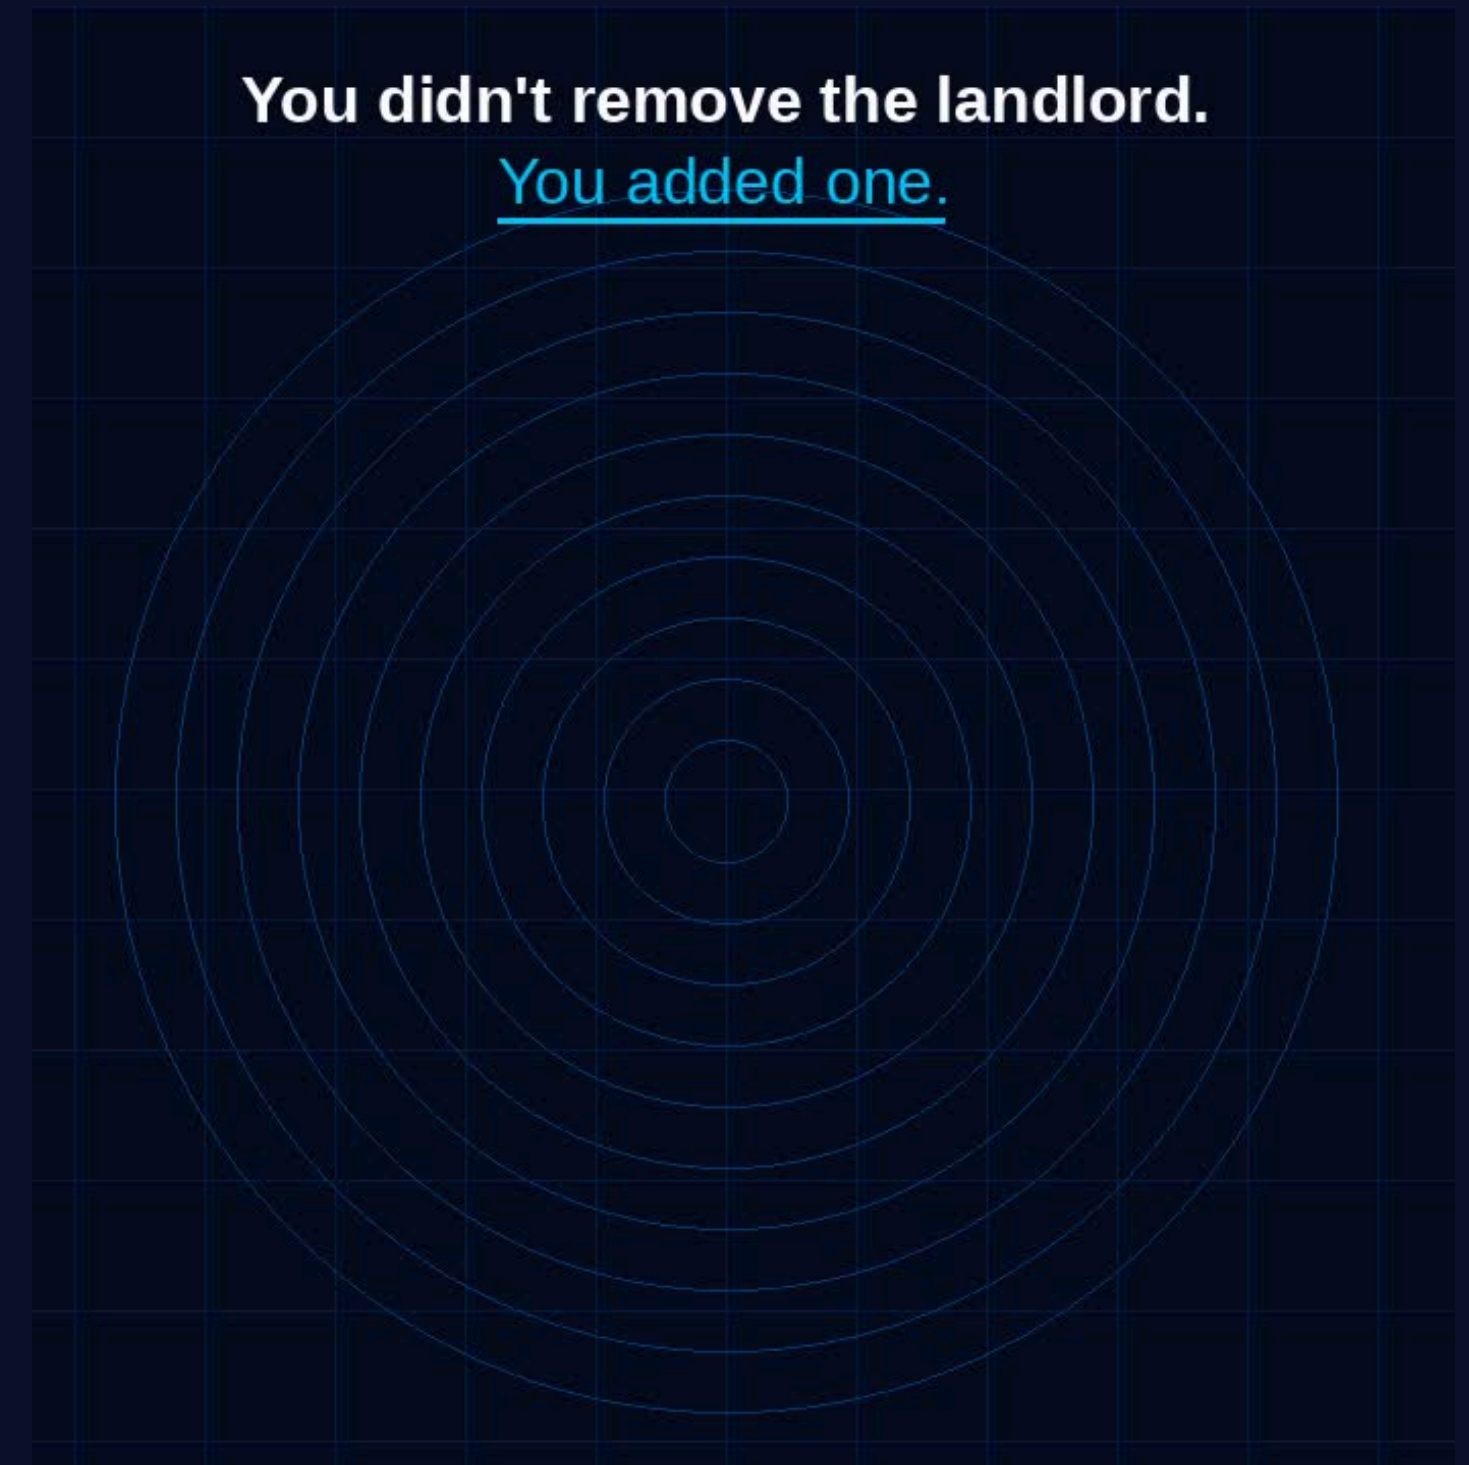

# 05 You can protect the data. You cannot protect away the owner.

- Each player's trust is assumed, not verified.
- SOC 2 certifies the process. It does not certify the motivations of every entity with physical access to the hardware your data touches.
- By default, the owner of that facility holds a position of access and leverage, whether your governance model accounts for them or not.

## WHY THIS MATTERS TO YOU

This is not zero trust.  
Only inherited trust at scale.

## FIVE QUESTIONS TO START WITH

1. Who owns the building your data lives in?
2. Under whose laws does that facility operate?
3. Who can legally compel access to it?
4. Where does the physical equipment come from?
5. Who owns the power supply and what can make it stop?

## THE GAP IN TODAY'S TOOLS

Include the following in your auditing process:

- Power distributors,
- Facility Operators,
- Vendor Relationships
- State/Local Collaborators

## Leadership & Governance

Add ownership, jurisdiction, and power supply to your third-party risk assessments.

## Operations & Resilience

Put the facility owner and the power supplier into your continuity and disaster-recovery planning.

## Government Relations & Procurement

Treat these as terms to negotiate, not assumptions to accept. The leverage is decided in the contract, before any system goes live.

# AI Race is the New Space Race

- Winning the Race = Owning the Balance of Power
- Landing on the Moon FIRST meant defining the age of innovation...until now.
- This is not a compliance problem. It's a national security imperative.
- The vulnerability is the power, supply chain and jurisdictional cooperation.
- China has streamlined their power, infrastructure and supply chain (2X more than US)

Super Guppy 1965

That's my Dad!

Total AI DC Grid Capacity by 2028

United States 25 GW

China 50 GW

Source: [United States 25 GW](#)

# Pulse Poll 4

---

**What's the first thing Monday morning you'll implement from this discussion?**

**The mission needs people who understand both  
the threat and the infrastructure beneath it.**

---

**Are you willing to accept your mission?**
