Be Nifty for 50

Be Nifty for 50

Must Has AI and Single Pain of GLASS

FARKETING

**People hate friction and will do
anything possible to avoid it.**

What should the function of a SOC be within that mission?

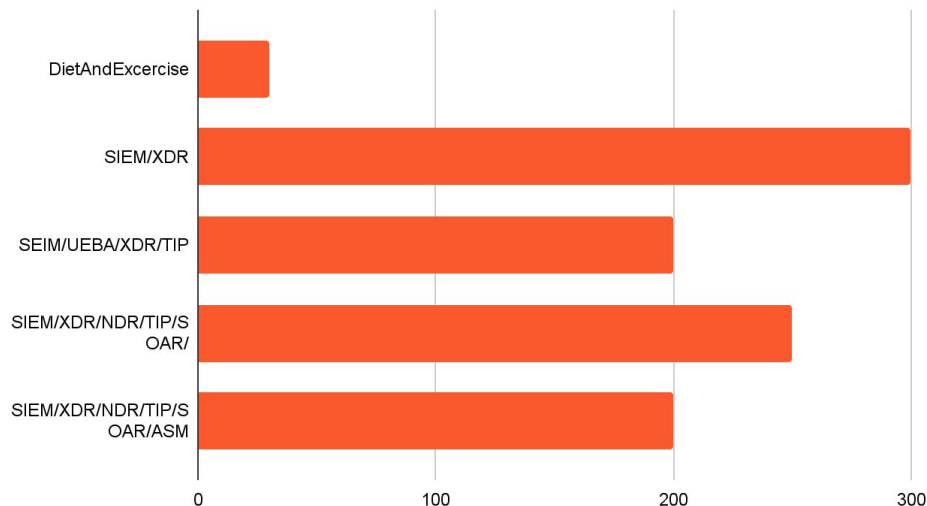

The SOC should **aggregate** and **analyse** signals, prioritise response and **coordinate** the **execution** of security tasks

Why the Pain Quadrant?

- There are many advertised features of SIEMS
- Then there is the day to day reality
- To truly transform a SOC, pain must be eliminated in a trust but verify manner:
 - Difficult investigations - Identity, Privileged Users, DCSYNC Attacks
 - Is my data there?
 - Playbook Creations
 - Workflows

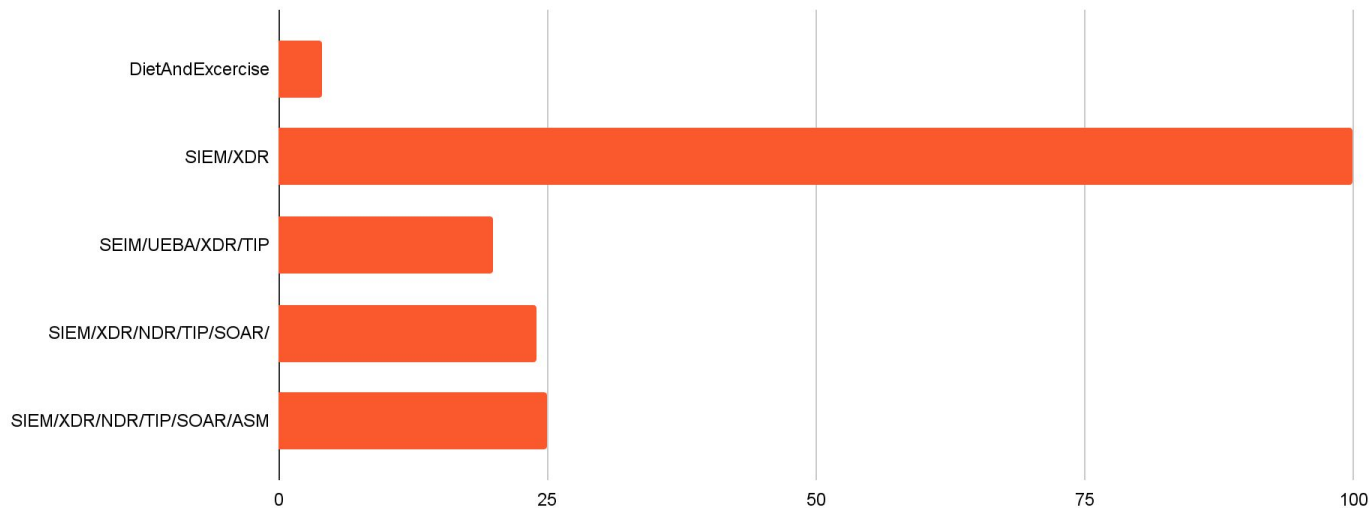

Identity Attacks

- How long to triage MITRE 1078(Valid Accounts) attack in their previous SIEM
- One account, creating 3 others for persistence
- Time to identify and start triaging is shown in minutes

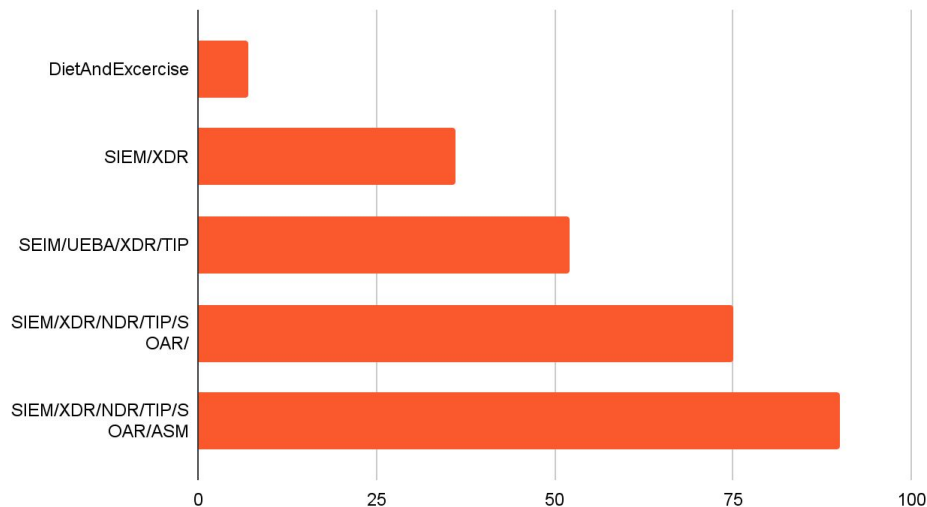

Privileged User Compromise/Malicious Insider

- This is truly a difficult one to find without broad ML running across various log sources
- Some customers admitted they could have never found this before without the right alerts
- Time to identify and start triaging is shown

Analyst Onboarding/Ease of Proficiency

- This represents a new user answering simple questions and closing an incident
- Who or What is involved, Is it Normal, What happened before, during, after event
- Proficiency in Weeks is Displayed

How Fast Is Your Response?

- Who Was Involved?
- What Was Involved?
- What Happened:
 - Before The Event
 - During the Event
 - After The Event
- Is This NORMAL?
- Is There Anyone Else Involved?

Thank YOU!
