

Robots vs Robots: Securing AI & the Data That Powers It

RVASec 2026

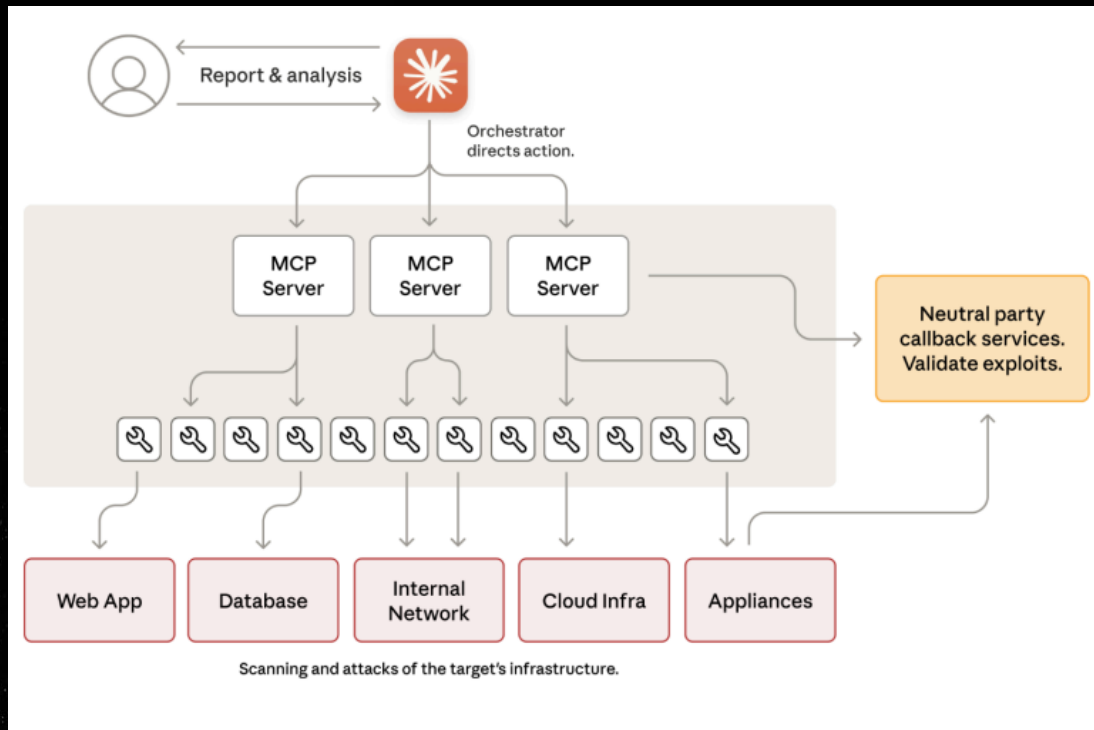

How adversaries use AI to steal your data

Offensive workflows

- + AI steers 80-90% operational tasks
- + Continuous recon
- + Attack chains masked as benign subtasks
- + AI-executed kill chain

Social Engineering Acceleration

+ Phishing

- + Crawl public sources at scale
- + Multi-channel attacks
- + Replies fed to LLMs

+ Deepfakes

- + Mimic voice and tone in real-time

**AI is also vulnerable to
attacks**

Why LLMs break traditional security assumptions

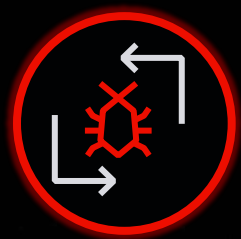

Structural Risks

- ⚠️ Blur instructions and data
- ⚠️ No built-in RBAC
- ⚠️ Excessive permissions
- ⚠️ Inability to forget
- ⚠️ Supply chain attacks

Output Risks

- ⚠️ Overreliance
- ⚠️ Nondeterministic
- ⚠️ Lacking guardrails
- ⚠️ Extreme autonomy

Jailbreaking and Prompt Injection

- + Manipulation of prompt to bypass controls and alter AI behavior to provide sensitive data
- + Generating or propagating malicious payloads

OpenClaw onboarding

Security

Security warning — please read.

OpenClaw is a hobby project and still in beta. Expect sharp edges.
This bot can read files and run actions if tools are enabled.
A bad prompt can trick it into doing unsafe things.

If you're not comfortable with basic security and access control, don't run OpenClaw.
Ask someone experienced to help before enabling tools or exposing it to the internet.

Recommended baseline:

- Pairing/allowlists + mention gating.
- Sandbox + least-privilege tools.
- Keep secrets out of the agent's reachable filesystem.
- Use the strongest available model for any bot with tools or untrusted inboxes.

Run regularly:

```
openclaw security audit --deep  
openclaw security audit --fix
```

Must read: <https://docs.openclaw.ai/gateway/security>

I understand this is powerful and inherently risky. Continue?
☐ Yes / ☒ No

RAG/Data Poisoning

- + Model pulls answers from external data sources
- + Malicious data injected into the external AI knowledge base
- + Attackers manipulate LLM to generate harmful outputs via “trusted” data
- + Operation Poison Fountain

AI Overview

Learn more

Cheese can slide off pizza for a number of reasons, including **too much sauce, too much cheese, or thickened sauce**. Here are some things you can try:

- Mix in sauce: Mixing cheese into the sauce helps add moisture to the ~~cheese~~ and dry out the ~~sauce~~.
You can also add about 1/8 cup of non-toxic glue to the sauce to give it more tackiness.
- Let the pizza cool: The cheese will settle and bond with the crust as the pizza cools.

Training Data Exposure

- + Inappropriate access to cloud datasets in IaaS (Azure, AWS, GCP, etc.)
- + Data exfiltration through misconfigured APIs and integrations
- + Compromised service accounts and non-human identities

NYT vs. OpenAI

- + NYT alleges OpenAI trained LLMs on millions of articles without permission
- + NYT content later appeared in model outputs
- + Frames case as persistent data exposure, not a traditional breach

Evolution of AI Use within Enterprises

Controlled Pilots

Deploying Agents

**Embedded AI in
SaaS Apps**

**Multi-Agent
Systems**

Machine identities now outnumber humans

- + Avg ratio of non-human to human identities in enterprises – 82:1 (CyberArk)
- + By 2027, 70% of new enterprise applications will use AI agents (Gartner)
- + Most operate unmonitored, over-privileged, and outside identity governance

Every new agent is a new identity to compromise

83%

of organizations report
using AI

13%

have strong visibility into
how AI interacts with data

State of Data Security Report

Quantifying AI's impact on data risk

Key Findings

AI adoption is outpacing security measures.

In our review of 1,000 organizations, we uncovered alarming data security issues.

99%

have sensitive data
unnecessarily exposed to
AI tools.

98%

have unverified apps,
including shadow AI,
within their environments.

90%

have sensitive files
exposed to all employees

Three questions most organizations cannot answer:

- + What AI systems are deployed in the environment
- + What sensitive data can agents and AI systems access
- + How are agents interacting with sensitive data

Threat actors are aware and taking advantage

Cyber Kill Chain

More identities to exploit

Expanded blast radius

Easier exfiltration

***Phish* for
credentials.**

***Login* with stolen
credentials.**

***Exploit* the
blast radius.**

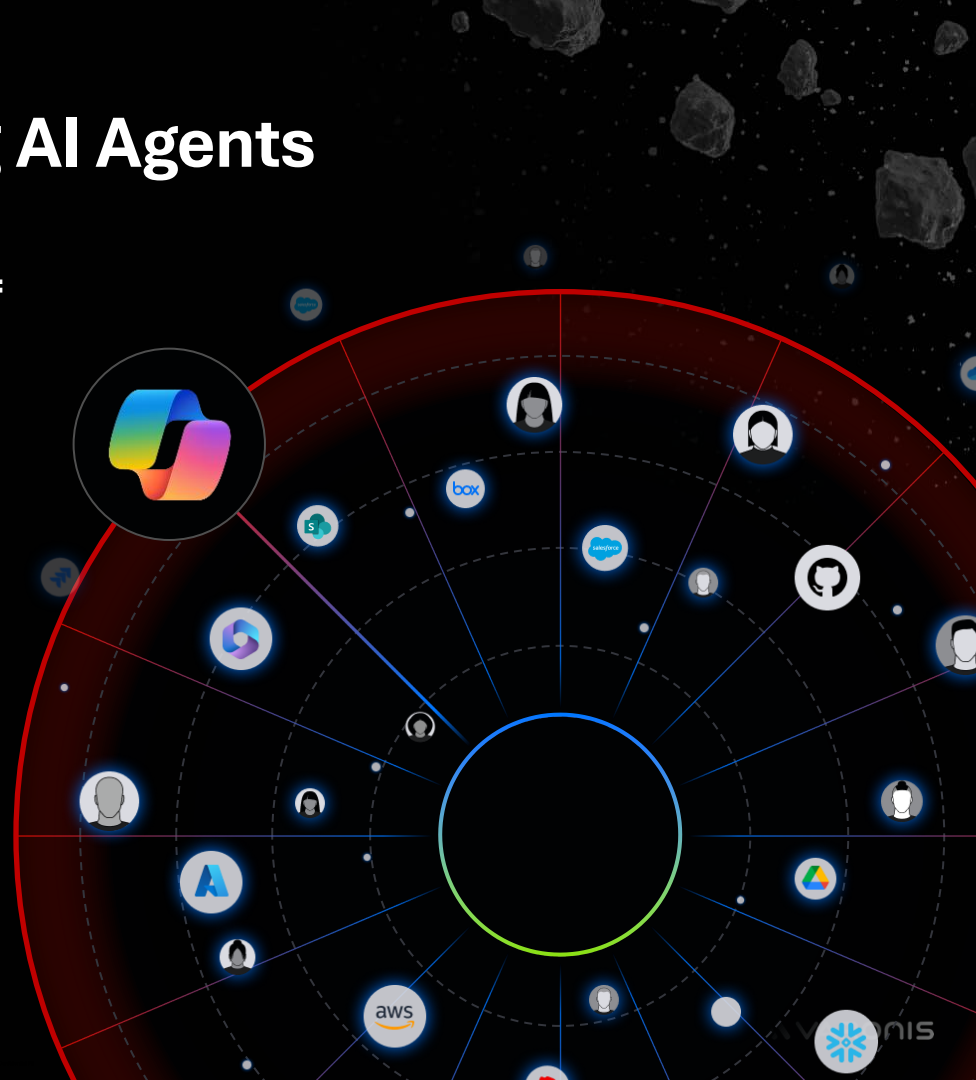

***Steal & encrypt*
critical data.**

Securing AI Agents

Control must extend to all elements of the AI lifecycle, including:

- ✓ AI Discovery
- ✓ AI Posture Management (AI-SPM)
- ✓ AI Runtime Protection
- ✓ AI Detection & Response (AIDR)
- ✓ AI Security Testing
- ✓ AI Compliance Management

Effective AI Security requires Data Security

Generic AI monitoring isn't enough. You need data-level visibility, controls, and monitoring.

Data Risk Assessment

- + Identify sensitive data across all data stores
- + Quantify your data security posture
- + Find your compliance gaps
- + Automatically reduce your blast radius
- + Real-time data and identity monitoring

AI Risk Assessment

- + Discover shadow AI across cloud and code
- + Identify CVEs and misconfigurations
- + Automated AI pen-testing reports
- + Monitor prompts and responses
- + AI compliance, governance, and TPRM

Thank you.
